What we expect from your solution

Six things the jury will look for in every solution

01 Use of AI across all SDLC phases

Requirements, design, development, testing, deployment and operations. Not code generation or demo alone

02 A governed harness

Detailed agent architecture, orchestration, context management and instruction design

03 Human checkpoints with reasoning

Where AI leads, where a person decides, what risk each gate controls and why

04 Evidence that it works

Evals with defined measures, results you can show and a feedback loop after failures.

05 A foundational data layer

Modelled and governed data the solution is actually reason over. *Synthetic data only*

06 Production ready

Scalability, security, reliability and token consumption analysis

Expect the panel to probe decisions, not features. Every choice you made, whether a gate, a model, an agent boundary or a fallback to plain logic, should have a reason behind it.

The AI-native toolchain, phase by phase

Starting points only. The stack is your choice, so bring your own if you can justify it.

REQUIREMENTS

Expand the brief

Deep research modes in Claude, ChatGPT, Gemini · NotebookLM · Perplexity

Output: a written spec in /docs

DESIGN

Architecture & UX

Figma · Excalidraw · Mermaid · draw.io · Miro

Output: diagrams + decision records

DEVELOPMENT

Build & orchestrate

Claude Code · Copilot · Cursor | LangGraph · CrewAI · Semantic Kernel · Agents SDK | pgvector · Azure AI Search

Output: working code + prompts in /ai

TESTING & EVALS

Prove it works

Ragas · DeepEval · promptfoo · Langfuse · LangSmith | Playwright · pytest · Jest

Output: eval sets, scores, defect trail

DEPLOYMENT

Ship it

Docker · Kubernetes · Azure Container Apps | GitHub Actions · Azure DevOps pipelines

Output: a repeatable deploy path

OPERATIONS

Watch and improve

Langfuse · Arize Phoenix · OpenTelemetry · Azure Monitor | token & cost dashboards

Output: monitoring + token analysis

Not permitted: prompt-to-app generators such as Lovable, Bolt and Replit Agent. AI-assisted coding inside a real codebase is encouraged.
